Abstract

An investigation is carried out to study the reclamation of used oil. The used oil includes engine oil, gear oil, industrial oil, transformer oil, hydraulic oil, etc. This paper identifies and describes the various methods that have been and are used to clean the spent oil and hence remove all the impurities so that the oil can be reused in some or the other way. Instead of disposing off the used oil, reclamation is more preferable as it can provide great environmental benefits and prove to be economical as well. As we are aware of the fact that oil does not wear out, so after removal of impurities we can use it again and again.
