Subject : Testing server for hosting the institute website in its current state for development of the Android application for the institute.

Respected Sir

The Android team at WSDC is developing a mobile application for the institute. As was previously discussed, the idea is to have a single Android app to access various important features of the Institute Website, Students' Portal and the Faculty Portal.

For pulling data from the institute website into the Android application, we'll need to add a layer of RESTful APIs to the existing Django application that runs the website. For smooth development of the Android app, we need a reliable testing server to host the website with the additional REST module. The module then would be deployed to the main server only after proper reviews by the concerned authorities.

Hence, kindly grant us permission to use a testing server for the above mentioned purpose.

Sincerely

Paras Jain
Technical Lead, WSDC
