Social networking site or social media is an online platform which people use to build social relations with other people. The social networking services in these sites vary in the format and the features/elements it contains. We have grouped the networks into some categories based on their functional capabilities such as Twitter for short text content, YouTube for video, and so on. A Peoples' Governance Forum Webpage is brought up with the intention to disseminate national integration among the students and provide basic awareness of how to use internet positively. It is awareness creation remedial forum. This paper includes the comparison of 'PGF' with some other prominent websites in context of degree of social media usage. We have tabulated a comparison feature study of websites and presented the significance of degree of social media considering a computational perspective of a few illustrative high degree value websites. The high SMD value of PGF has increases our campaign benefits and results in the sense that there is more awareness generation about the cybercrimes case study and the PGF-initiated remedial approach. We have presented that the highSMDvalue-PGF used as awareness generation forum (among the stakeholders of academics such as the students, teachers, academic authorities in JNTUH academic environment) and sensitize the academic stakeholders accordingly such that the recurrence of similar cybercrimes is prevented in Telangana, thus promoting the values of national integrity, national integration, academic ethics, respect for the constitution, national solidarity and national consciousness.
